

Examination Feedback for EEE6423 – Introduction to
Biomedical Imaging Science - Autumn Semester
2015-16

Feedback for EEE6423 Session: 2015-2016

General Comments:

In general students handle the exam very well and demonstrated a solid understanding of the different aspects (imaging and computational) outlined in the course. The most correctly answered part was Question 1, where the students did not have to do computations or derive a concept. The Questions 2-4 were treated almost equally good across all students. In these questions there were some computational inquiries, where the loss of interest or accuracy in the answers were some times clear. The lack of enough mathematical background required by the course was pronounced for a group of students.
