**(6)** 

**Data Provided: None** 

## DEPARTMENT OF ELECTRONIC AND ELECTRICAL ENGINEERING

Autumn Semester 2006-2007 (2 hours)

## Multimedia Systems 1

Answer **THREE** questions. **No marks will be awarded for solutions to a fourth question.** Solutions will be considered in the order that they are presented in the answer book. Trial answers will be ignored if they are clearly crossed out. **The numbers given after each section of a question indicate the relative weighting of that section.** 

- 1. a. What are the chief desirable features of any computer network? (3)
  - **b.** List three of the main functions of the *Transmission Control Protocol* (TCP). (3)

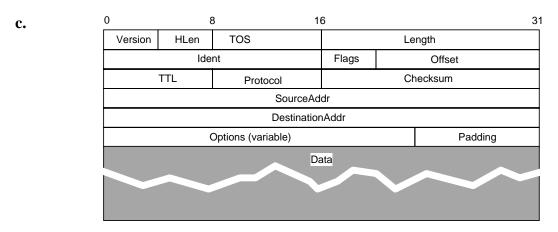

Fig. 1

Fig. 1 shows the header structure of an IP datagram. Name 3 fields that are used for reassembly of the fragmented datagram units at the destination host and briefly explain the function of each of the three fields.

- **d.** (i) Explain what is meant by *connectionless* communication.
  - (ii) Give an example for a transport layer protocol that uses connectionless communication. (3)
- e. Calculate the time to send a 200 byte IP datagram across a 100 km coaxial cable link working at 200 Kbps. Assume the propagation velocity is 1 x 10<sup>8</sup> ms<sup>-1</sup>. (5)

**(2)** 

		EEE110	
a.	List three advantages of representing signals in a digital format rather than in an analogue one.		(3)
b.	(i)	In relation to the sampling of a continuous signal, state <i>Nyquist's Sampling Limit</i> .	
	(ii)	Graphically indicate what the reconstructed signal looks like if the sampling is above or below the Nyquist Limit.	(4)
c.	Draw a block diagram of a system for digitisation of an audio signal and briefly explain the functionality of the main components of the system.		(5)
d.	The digitisation of an analogue audio signal with amplitude varying between values 0.5 V and -0.5V results in a digital signal with 352 kbps data rate. The digitisation process uses a sampling clock with frequency 32 kHz.		
	(i)	What is the highest frequency of a signal that can be recorded using this digitisation process?	
	(ii)	What is the quantisation step used in the quantiser in this analogue-to-digital conversion?	(6)
e.	CD quality audio is digitised using 44.1 kHz sampling rate with 16 bits per sample quantisation. What will be the effect on the audio quality if 8 bits per sample quantisation is used, instead of 16 bits per sample?		(2)
a.	State why multimedia data compression is possible and why it is often necessary.		(3)
<b>b.</b>	What is the difference between <i>lossless</i> image compression and <i>lossy</i> image compression?		
	Give an example and an application of each.		(4)
c.			
	Derive the Huffman code for this restricted alphabet.		(7)
d.	length bir	nary code, what compression ratio can be achieved by using the	(4)

An information source outputs 6 different symbols {A, B, C, D, E, F} with the corresponding probabilities of occurrence as {0.4, 0.06, 0.08, 0.12, 0.25, 0.09}, respectively.</li> <li>Derive the Huffman code for this restricted alphabet.</li> </ul>

Verify that the derived code in question **3.c.** is unambiguous.

e.

- **4.** Explain why we use the luminance and two chrominance signals form (Y C<sub>b</sub> C<sub>r</sub>) rather than the additive primary colour form (Red-Green-Blue) for colour television broadcasting?
- (3)
- **b.** You have been asked to assist in the development of a television broadcast system for an alien species, the *Clangers*, who have different visual abilities to our own.

Using the information given below, carry out these requirements – giving, where appropriate, brief explanations of your working.

- i. Calculate the required resolution of the display in terms of number of pixels.
- ii. Calculate the practical memory requirements, in bytes, to store one frame. (4)
- iii. Estimate the channel bandwidth required for uncompressed television transmissions. (3)
- iv. If the *Clangers* are like us and possess inferior ability to perceive fine detail in the chrominance information, explain how this can be exploited to obtain a 50% reduction of the overall bandwidth need. (4)
- v. Recommend a digital video compression standard that can be used for further reduction of the data rate. (2)

Information on Clangers' visual system and other requirements:

- Aspect ratio of television display (width:height) = 4:3.
- *Clangers*' spatial frequency cut-of (horizontal and vertical) = 150 cycles/degree subtended to their eye.
- Clangers have only two types of colour receptor on the retinas, can perceive approximately 38,000 different colours (hues) and can distinguish some 200 different intensity levels.
- Clangers can detect intensity flicker up to 80 Hz at the illumination levels typical in television displays. They, like us, are less prone to perceive flicker over small areas.
- *Clangers* sit, on average, 12 times the display height away from their televisions.
- Available transmission bandwidth is at a premium and every effort needs to be made to minimise it.
